

Employee Attrition Analysis – Executive Summary

Overview: This analysis was conducted to understand the key factors influencing employee attrition and help HR identify employees at risk of leaving. The study used employee data such as job role, department, salary, work experience, and work conditions to identify patterns behind turnover.

Key Findings: The most important factors influencing attrition are OverTime, MonthlyIncome, and YearsAtCompany. Employees with frequent overtime, lower salaries, and shorter tenure are more likely to leave. Attrition is higher in Sales departments and Sales Executive roles.

Salary alone is not the only factor affecting attrition. Workload, job satisfaction, and work-life balance have a stronger combined impact.

HR Insights: Employees with high overtime and early tenure are at greater risk. Sales roles show higher turnover compared to other departments.

Recommendations: (1) Reduce overtime pressure through workload balancing and flexible work options. (2) Conduct stay interviews for high-risk employees such as Sales Executives and early-career staff.

Limitations: This model is based on historical data and cannot capture real-time emotional or personal factors. It should be used as a decision-support tool, not a replacement for HR judgment.

Conclusion: Attrition is driven by workload, experience, and compensation. Addressing overtime and improving engagement can significantly improve retention.
